

USB Type-C Port Protector for CC and SBU Pins

Features

- Over-Voltage Protection
 - ▶ 24VDC Tolerance on CC1/2, SBU1/2
 - ► CC1/2 OVP = 5.8V
 - ► SBU1/2 OVP = 3.83V
 - ▶ Ultra-Fast 15ns Response Time
- IEC61000-4-5 Surge Protection
 - ▶ ±40V Surge Tolerance on CC1/2
 - ▶ ±30V Surge Tolerance on SBU1/2
- IEC61000-4-2 ESD Protection
 - ▶ ±15kV air gap on CC1/2, SBU1/2
 - ▶ ±8kV contact on CC1/2, SBU1/2
 - ► ±2kV HBM on all pins (JEDEC JS-001-2017)
- CC Switches:
 - ► 1.25A, 270mΩ, 40pF, 140MHz
 - ► Automatic 5.1kΩ dead battery pull-down
- SBU Switches:
 - ► 3Ω, 11pF, 800MHz
- 2.5V to 5.5V Operating Supply Voltage Range
- -40°C to 85°C Operating Temperature Range
- 16-bump WLCSP 1.7mmx1.7mm (0.4mm pitch)
- RoHS and Green Compliant

Brief Description

The KTU1120 provides four conducting paths with overvoltage protection (OVP) for USB Type-C, CC, and SBU signals. Once an over-voltage event is detected, it will shut down all paths to protect circuits in system side, like PD controller from damage.

All the SBU and CC switches have very low oncapacitance for broad bandwidth to allow high-speed signal passing through without loss. The CC1/2 switches have low on-resistance for passing V_{CONN} power up to 1.25A.

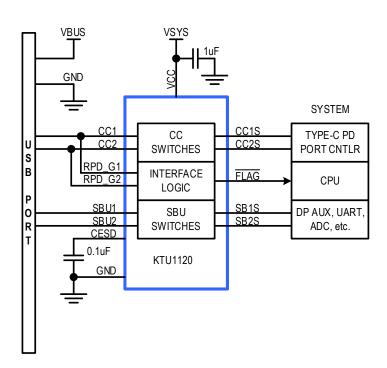

During dead battery conditions, internal $5.1k\Omega$ resistors automatically pull down on CC1/2 to ensure that the upstream source provides 5V on VBUS.

The KTU1120 is packaged in RoHS and Green compliant 16-bump WLCSP 1.7mmx1.7mm package.

Applications

- Notebook PCs, Netbooks, Tablets, Monitors, TVs
- Gaming Devices, Set-Top Boxes, Networking

Pin Descriptions

Pin # (CSP)	Name	Function
B1	SBU1	Connector side of SBU1 switch
A1	SBU2	Connector side of SBU2 switch
A4	CESD	Capacitor connection for ESD protection for CC1, CC2, SBU1 and SBU2 inputs
A2	CC1	Connector side of CC1 switch
А3	CC2	Connector side of CC2 switch
C1 ~ C3	GND	Ground
B4	FLAG	Active low fault flag output to alert system to an OVP fault condition
C4	VCC	Device supply input – connect to a 2.5V to 5.5V source.
D4	CC2S	System side of CC2 switch
D3	CC1S	System side of CC1 switch
D2	SB2S	System side of SBU2 switch
D1	SB1S	System side of SBU1 switch
B2	RPD_G1	Dead battery resistor setup: Short to CC1 if dead battery resistors are needed. Short it to GND if not needed
В3	RPD_G2	Dead battery resistor setup: Short to CC2 if dead battery resistors are needed. Short it to GND if not needed

Absolute Maximum Ratings²

(T_A = 25°C unless otherwise noted)

Symbol	Description	Value	Units
Vcc	VCC to GND	-0.3 to 6	V
	CC1, CC2, RPD_G1, RPD_G2, SBU1, SBU2 to GND	-0.3 to 24	
V_{IO}	CC1S, CC2S, SB1S, SB2S to GND	-0.3 to 8	V
	FLAG to GND	-0.3 to 6	
	CCn to CCnS Continuous Current	±1250	
I_{IO}	CCn to CCnS Peak Current (2.5ms)	±2000	mA
	SBUn to SBnS, Continuous Current	±100	
V_{CESD}	CESD to GND	-0.3 to 24	V
TJ	Operating Temperature Range	-40 to 150	°C
Ts	Storage Temperature Range	-55 to 150	°C
T_{LEAD}	Maximum Soldering Temperature (at leads, 10 sec)	260	°C

ESD and Surge Ratings³

Symbol	Description	Value	Units
V _{ESD_HBM}	JEDEC JS-001-2017 ESD Human Body Model (all pins)	±2	kV
V _{ESD_CDM}	JEDEC JESD22-C101 Charged Device Model (all pins)	±500	V
V _{ESD_CD}	IEC61000-4-2 ESD Contact Discharge (CC1, CC2, SBU1, SBU2)	±8	kV
Vesd_agd	IEC61000-4-2 ESD Air-Gap Discharge (CC1, CC2, SBU1, SBU2)	±15	kV
\/	IEC61000-4-5 Surge (CC1, CC2 to GND)	±40	V
Vsurge	IEC61000-4-5 Surge (SBU1, SBU2 to GND)	±30	V

Thermal Capabilities⁴

Symbol	Description	Value	Units
WLCSP-16			
θја	Thermal Resistance – Junction to Ambient	96	°C/W
P _D	Maximum Power Dissipation at T _A ≤ 25°C	1300	mW
ΔΡ _D /ΔΤ	Derating Factor Above T _A = 25°C	-10.4	mW/°C

² Stresses above those listed in Absolute Maximum Ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied. Only one Absolute Maximum rating should be applied at any one time.

³ ESD and Surge Ratings conform to JEDEC and IEC industry standards. Some pins may actually have higher performance. Surge ratings apply with chip enabled, disabled, or unpowered based on Kinetic EVB, unless otherwise noted.

⁴ Junction to Ambient thermal resistance is highly dependent on PCB layout. Values are based on thermal properties of the device when soldered to an EV board.

Electrical Characteristics⁵

Unless otherwise noted, the *Min* and *Max* specs are applied over the full operation temperature range of -40° C to $+85^{\circ}$ C and $V_{CC} = 2.5$ V to 5.5V. Typical values are specified at $T_A = +25^{\circ}$ C with $V_{CC} = 3.0$ V.

Supply Specifications

Symbol	Description	Conditions	Min	Тур	Max	Units
Vcc	Supply Operating Range		2.5		5.5	V
	Under-Voltage Lockout Threshold	Rising threshold	2.12	2.3	2.48	V
Vuvlo		Hysteresis		100		mV
Icc	Supply Current	$V_{CC} = 3.0V$		40		μA

Logic Specifications

Symbol	Description	Conditions Min		Тур	Max	Units
VoL	Output Logic Low (FLAG)	Iosink = 3mA		0.1	0.4	V
lo_lk	Output Logic Leakage (FLAG)	$T_A = +25$ °C, $V_O = high-Z$ or V_{CC}		0.01	1	μA
t _{FLAGB}	FLAG Response Time (with 100k pull-up) ⁶	Activation		45		ns
t _{FLAG_RECOVER}	From OVP removed to FLAG recovered			5		ms

Functional Block Diagram

Functional Description

The KTU1120 integrates 4 switches to provide over-voltage protections for CC and SBU channels. Once there is a high voltage applied on any of them, for example, any of CC1/2 and SBU1/2 is shorted to VBUS (CC and SBU are adjacent to VBUS for a type-C connector.), all switches will be turned off to prevent the harmful voltage from being sent to system inside.

Power Up and Down

After V_{CC} ramps up and beyond UVLO, part will turn on CC and SBU switches with respective delays of to_{N_CC} and to_{N_SBU}. However, longer time of to_{N_DB_DELAY} needs to wait for exiting DB (disconnecting 5.1k from CCx to GND) if RPD_G1 and RPD_G2 are all connected to CC1 and CC2 respectively, until stable connections have been established for CC channels.

When V_{CC} ramps down and below UVLO, all switches are turned off, and DB resistors are re-connected immediately. More details could be found from "Power Up and Down" in "Timing Diagram" section.

Table 1. Control Logic Table (RPD_G1 and RPD_G2 are Connected to CC1 and CC2 Respectively)

IC Power	Conditions	Sw	Switch On/Off Status			
ic Power	Conditions	CC1/2	SBU1/2	Dead Battery	FLAG	
	No Faults	ON	ON	OFF	High-Z	
Mara Mana	Vcc1/2 > Vovp_cc	OFF	OFF	ON	Active Low	
Vcc > Vuvlo	V _{SBU1/2} > V _{OVP_SBU}	OFF	OFF	ON	Active Low	
	$T_J > T_{J_SHDN}$	OFF	OFF	OFF	Active Low	
Vcc < Vuvlo	$V_{CC1/2} = 2.6V$	OFF	OFF	ON	High-Z	

Dead Battery Automatic 5.1kΩ Pull-Down

KTU1120 integrated pull down resistor from CCx to GND, which can be enabled by connecting RPD_G1 to CC1 and RPD_G2 to CC2. When under dead battery condition, DFP or adpaper can recognize the device through these pull down resistors and start to feed power in. After CC channels are turned on, KTU1120 cut those pull down resistors automatically with a short period of delay. And it reconnects those resistors when CCx channels are off, for example caused by UVLO or OVP, except OTP event.

See Figure 2 and Figure 3 for more details.

If no need for dead battery resistors, please short both RPD_G1 and RPD_G2 to ground.

Over-Voltage Protection

Once any of those channels meet with OVP event, KTU1120 will shut all channels at once. FLAG will be pulled low to indicate there is a fault. After part is recovered, FLAG would be released to High-Z again automatically.

Over-Temperature Protection

KTU1120 will also turn off all channels when OTP happens. FLAG will be pulled low to indicate there is a fault. However, dead-battery resistors will not be presented when OTP is lasting. They will be presented when OTP is over and before CCx channels are closed. See Figure 2.

Applications Information

For typical USB Type-C CC and SBU input port protection applications, only two external components are required for the KTU1120 to provide protection functions.

Input Supply and Bypass Capacitor Selection

Place a 1.0μF/10V ceramic capacitor between the VCC pin and ground. X5R or X7R dielectric ceramic capacitors are preferred for input supply bypassing applications as they maintain better capacitance value and tolerances over operating voltage and temperature ranges when compared to lower cost Y5V dielectric type ceramic capacitors.

ESD Capacitor

KTU1120 utilizes an ESD support capacitor to meet ESD protection requirements. The ESD support capacitor should be placed between the CESD pin and ground. The CC1/2 and SBU1/2 inputs can have as much as 20V applied during a short-to-VBUS event. A $0.1\mu F/50V$ X5R or X7R dielectric ceramic capacitor is recommended for this application.

Dead Battery Detection / Operation

USB Type-C specification allows the host and peripheral device to charge internal batteries through the Type-C port receptacle. Dead battery detection is an important feature that allows a device to be charged when its internal battery supply is depleted. Another scenario for dead battery support is when the CC1/2 or SBU1/2 switches are shut down due to an OVP condition. Automatic 5.1k Ω dead battery pull-down resistors on the CC1/2 inputs signal to a connected upstream USB current source PD host or wall adapter to allow charging through the USB Type-C port VBUS. When an applied adapter senses a 5.1k Ω pull down on CC1/2, 5V should be applied to the VBUS line to enable charging. For this reason, the KTU1120 contains an automatic dead battery sub-circuit. The CC1/2 pin impedance to ground is 5.1k Ω when the IC is shut down by the UVLO function due to a dead battery. When the IC is enabled under regular operation conditions, the CC1/2 impedance to ground is switched to over 10M Ω to support normal CC line functions. Refer to Table 1 for the control logic of CC1/2 line-states versus operation conditions.

Moisture Testing

In systems that perform moisture detection on the USB port, it is typical to apply a test current through the KTU1120 and out of the connector-side pins. Moisture presents itself as a resistance path from the connector-side pins to ground. The threshold for moisture detection is usually less than $1M\Omega$ of external leakage resistance to ground. To simplify moisture detection, the KTU1120 features over $10M\Omega$ internal impedance from the connector-side pins to ground. However, it is important to keep in mind that KTU1120's internal impedance reduces when the voltage on the connector-side pins (CC1/2, SBU1/2) is greater than the device supply voltage (Vcc). Therefore, it is important to use a weak test current for a suitably low moisture detection threshold. An alternate solution is to use a pullup resistor to a voltage source, for example, $30k\Omega$ pull-up to 2.7V.

Fault Flag Operation

The KTU1120 fault flag will alert the system controller to an OVP, surge or IC over temperature fault. The fault flag circuit is an open-drain MOSFET output that connects the \overline{FLAG} pin to ground when there is an active fault condition. Refer to the IC functional block diagram for internal fault flag circuit connections. Common system controllers can typically be configured to place a logic pull up on the fault flag input signal, in these cases the \overline{FLAG} output can be connected directly to the controller I/O. If a logic pull-up termination is not available, the \overline{FLAG} output may be manually pulled-up high to a logic level voltage supply through a $10k\Omega$ or greater value resistor.

Recommended PCB Layout

See Figure 4 for an example PCB layout. When laying out a PCB, follow the below guidelines:

- Place the bypass capacitors as close as possible to the VCC pin, and ESD protection capacitor as close as
 possible to the CESD pin. Capacitors must be attached to a solid ground. This minimizes voltage disturbances
 during transient events such as short-to-VBUS and ESD strikes.
- 2. The SBU lines must be routed as straight as possible, and any sharp bends must be minimized. Standard ESD recommendations apply to the CC1, CC2, SBU1, SBU2.
- The optimum placement for the device is as close to the connector as possible:

- EMI during an ESD event can couple from the trace being struck to other nearby unprotected traces, resulting in early system failures.
- The PCB designer must minimize the possibility of EMI coupling by keeping any unprotected traces away from the protected traces which are between the KTU1120 and the connector.
- 4. Route the protected traces as straight as possible.
- 5. Eliminate any sharp corners on the protected traces between the TVS and the connector by using rounded corners with the largest radii possible.
